Lesson Focus
Lesson focuses on how the shape of ship's hull can impact its speed and stability potential in water. Teams of students design their own ship's hull on paper, and build it using Styrofoam and other everyday materials. Teams review all hull designs, predict which will go farthest, and then test their design on water using a pull meter or rubber band for propulsion. Teams evaluate all hull designs, reflect on their findings, and present to the group.

Lesson Synopsis
The Hull Engineering lesson explores how hull shape impacts performance and stability of ships. Students design, build, and test their own hull design, predict the performance of the various shapes developed, and present their findings to the group.

Age Levels
11-18.

Objectives

- Learn about engineering design.
- Learn about ship design and engineering.
- Learn about teamwork and working in groups.

Anticipated Learner Outcomes
As a result of this activity, students should develop an understanding of:

- naval engineering and marine architecture
- engineering testing
- problem solving
- teamwork

Lesson Activities
Students learn how the shape of a product, such as a boat hull can impact performance. Student teams design their own ship hull first on paper and then out of Styrofoam, predict the distance their ship and others will travel on a simple waterway, test the ships, and evaluate results. Student teams evaluate their own work and that of other students, and then present their observations to the class.

Recommended Reading

- Introduction to Naval Architecture (ISBN: 0750665548)

Optional Writing Activity

- Computer modeling has become an integral part of engineering design over the past twenty years. Suggest some possible reasons for the popularity of this tool and how modeling on a computer benefits engineering design.
Lesson Goal
Lesson focuses on how the shape of ship's hull can impact its speed and stability potential in water. Teams of students design their own ship's hull on paper, and build it using Styrofoam and other everyday materials. Teams review all hull designs, predict which will go farthest, and then test their design on water using a pull meter or rubber band for propulsion. Teams evaluate all hull designs, reflect on their findings, and present to the group.

Lesson Objectives
- Learn about engineering design.
- Learn about ship design and engineering.
- Learn about teamwork and working in groups.

Materials
- Student Resource Sheet
- Student Worksheets
- Materials to build classroom waterway: long waterproof container such as a planter, or gutter section with end pieces attached; push-pull meter (available from Delta Education for about $6) or materials to build propulsion system (rubber band, measuring tape, cardboard, fasteners); measuring tape to determine how far a boat travels.
- One set of materials for each group of students: equal sized blocks of hard Styrofoam, cutting tools (plastic or other knives), optional duct or other tape to eliminate water absorption. (Optionally, students may decorate their boats using toothpicks, paper, foil, etc.)

Procedure
1. Show students the various Student Reference Sheets. These may be read in class, or provided as reading material for the prior night’s homework. Divide students into groups of 2-3 students, providing a set of materials per group. Give each team a "name."
2. Explain that students are now an "engineering" team that must develop a new hull design for a ship that will be tested to determine which will go the farthest while remaining stable on the water.
3. Students meet and develop a plan for their hull which they will design on paper.
4. Next, students create their hull by cutting the Styrofoam block to match their design specifications. (Safety note: plastic knives will work in hard Styrofoam; supervision may be required for safety purposes, or teachers may serve as the manufacturing facility and complete the cutting to the student team specifications.)
Procedure (continued)

5. Student teams next review all the hull designs to be tested, and predict the distances each will travel. (The prediction process may be assigned as homework to reduce in-school time required for lesson.)

6. The teacher should set up the waterway; only one is needed for all testing. Add water to a trough or sealed gutter section and tape either a push-pull meter or similar set-up to one end. Mark the length of the waterway with measuring tape or other marks to indicate how far a boat travels. Testing will be done by teachers to ensure consistency. Test each boat with different levels of propulsion, pulling the rubber band back to "3," "6," and "8" to see how the hull function at different levels. Students record the results of each test, noting distance spanned and stability.

7. Each student group evaluates the results, completes an evaluation/reflection worksheet, and presents their findings to the class.

Tips
- Use caution with all children when they are cutting the Styrofoam blocks to match their design shape.
- Assign each team a "name" or "number" that they can write on their hulls to identifying them during testing.

Time Needed
Two to four 45 minute sessions
What do Marine Engineers and Naval Architects Do?
Marine engineers and naval architects are involved in the design, construction, and maintenance of ships, boats, and related equipment. They design and supervise the construction of everything from aircraft carriers to submarines, and from sailboats to tankers. Naval architects work on the basic design of ships, including hull form and stability. Marine engineers work on the propulsion, steering, and other systems of ships. Marine engineers and naval architects apply knowledge from a range of fields to the entire design and production process of all water vehicles.

Type of Vessels
There are a wide range of vessels that are designed and tested by marine engineers and naval architects including:

- Merchant Ships - oil/gas tankers, cargo ships, bulk carrier, container ships
- Passenger/vehicle ferries, cruise ships
- Warships - frigates, destroyers, aircraft carriers, amphibious ships, etc.
- Submarines and underwater vehicles
- Icebreakers
- Offshore drilling platforms, semi-submersibles
- High Speed Craft - hovercraft, multi-hull ships, hydrofoil craft, etc.
- Workboats - fishing boat, platform supply vessel, tug boat, pilot vessels, rescue craft, etc.
- Yachts, power boats, and other recreational craft.

How Important is Testing?
Scientists and engineers use testing systems to evaluate the performance of equipment of all types before construction. Testing can take a variety of forms including wind tunnels, computer simulation, model making, and prototype fabrication. Naval Architects and Marine Engineers are particularly interested in hull shape to predict the performance of a marine vessel. Different hull designs are better for different functions. For example, the catamaran is a type of boat or ship consisting of two hulls joined by a frame. They have a higher average speed than do single or monohull sailing ships.
Hull Shapes

◆ Monohull
A monohull is a type of boat having only one hull. It is the most prevalent form of waterborne vessel. Monohull boats frequently ride deeply in the water.

◆ Submarines
All small modern submarines and submersibles, as well as the oldest ones, have a single hull. However, for large submarines, the approaches have separated. All Soviet heavy submarines are built with a double hull structure, but American submarines usually are single-hulled. The double hull of a submarine is different from a ship's double hull. The external hull, which actually forms the shape of submarine, is called outer hull or light hull.

◆ Catamaran
A catamaran is a type of boat or ship consisting of two hulls joined by a frame. Catamarans can be sail- or engine-powered. The catamaran was the invention of the paravas, a fishing community in the southern coast of Tamil Nadu, India. Catamarans were used by the ancient Tamil Chola dynasty as early as the 5th century AD for moving their fleets to conquer such Southeast Asian regions as Burma, Indonesia and Malaysia.

◆ Trimaran
A trimaran is a multihull boat consisting of a main hull (vaka) and two smaller outrigger hulls (amas), attached to the main hull with lateral struts (akas). The design and names for the trimaran components are derived from the original proa constructed by native Pacific Islanders. The first trimarans were built by indigenous Polynesians almost 4,000 years ago, and much of the current terminology is inherited from them.

◆ Coracle
A coracle is a small, lightweight boat used mainly in Wales and in parts of Western and South Western England but also found across many parts of the British Isles. Oval in shape and very similar to half a walnut shell, the structure is made of a framework of split and interwoven willow rods, tied with willow bark. The structure has a keel-less, flat bottom to evenly spread the weight of the boat and its load across the structure and to reduce the required depth of water - often to only a few inches, making it ideal for use on rivers.
Hull Engineering

Student Worksheet: Hull Engineering and Testing

You are a team of engineers who have been given the challenge of developing a new hull design for a ship that will be tested to determine which will go the farthest while remaining stable on the water.

♦ Research/Preparation Phase
1. Review the various Student Reference Sheets.

♦ Planning as a Team
1. Your team has been provided with a block of Styrofoam and other materials.
2. Start by meeting with your team and devising a design for your ship hull. Your hull will need to be stable and not flip over in the water when moved, and your goal is to have your hull design move further than any of the others developed in your classroom. You can make your hull any shape you like however.
3. Write or draw a cross section of your plan in the box below, and be sure to include detailed measurements so that when you execute the plan (build the hull out of Styrofoam) you are very precise about where cuts should be made in your block. Mark the grid below with your own measurements so your design is clear.
### Hull Engineering

**Student Worksheet:**
**Hull Engineering and Testing (continued)**

- **Construction Phase**
  1. Carve your hull design out of the block of hard Styrofoam you have been provided. Be especially careful of sharp edges. You may have been provided with additional materials such as duct tape or other materials to decorate your ship. If so, this is the time to include these items.

- **Competitive Analysis Phase**
  1. Take a good look at all the hulls created by other "engineering" teams in your classroom. Notice the differences, and as a team, make predictions of the distance you think the competition will achieve at the different propulsion levels of the testing device. Later, you'll use this sheet to mark down the actual results after testing.

- **Hull Testing**
  1. Observe as your team and other teams test their prototypes in your classroom waterway. Record your team’s results in the box below, including points and observations.

Student Worksheet: Evaluation

---

Reflection

1. How did your hull design perform compared to other teams in your classroom?

2. What do you think was the aspect of the design of the hull that performed the best?

3. If you had to do it all over again, how would your planned design change? Why?

4. Do you think that engineers have to adapt their original plans during the manufacturing process? Why might they?
5. What designs or methods did you see other teams try that you thought worked well on either a performance or aesthetic level? What appealed to you?

6. Did you find that there were many designs in your classroom that met the project goal? What does this tell you about engineering plans?

7. Explain how teamwork impacted your team's performance on this project.

8. How many products can you think of that would benefit from prototype testing?
For Teachers: Alignment to Curriculum Frameworks

Note: Lesson plans in this series are aligned to one or more of the following sets of standards:
- U.S. Science Education Standards (http://www.nap.edu/catalog.php?record_id=4962)
- U.S. Next Generation Science Standards (http://www.nextgenscience.org/)
- International Technology Education Association's Standards for Technological Literacy (http://www.iteea.org/TAAPDFs/xstnd.pdf)

Alignment to Curriculum Frameworks (continued)

◆ National Science Education Standards Grades 9-12 (ages 14-18)  
  CONTENT STANDARD F: Science in Personal and Social Perspectives  
  As a result of activities, all students should develop understanding of  
  ✦ Science and technology in local, national, and global challenges  
  CONTENT STANDARD G: History and Nature of Science  
  As a result of activities, all students should develop understanding of  
  ✦ Science as a human endeavor  

◆ Next Generation Science Standards Grades 3-5 (Ages 8-11)  
  Motion and Stability: Forces and Interactions  
  Students who demonstrate understanding can:  
  ✦ 3-PS2-1. Plan and conduct an investigation to provide evidence of the effects of balanced and unbalanced forces on the motion of an object.  

  Engineering Design  
  Students who demonstrate understanding can:  
  ✦ 3-5-ETS1-1. Define a simple design problem reflecting a need or a want that includes specified criteria for success and constraints on materials, time, or cost.  
  ✦ 3-5-ETS1-2. Generate and compare multiple possible solutions to a problem based on how well each is likely to meet the criteria and constraints of the problem.  
  ✦ 3-5-ETS1-3. Plan and carry out fair tests in which variables are controlled and failure points are considered to identify aspects of a model or prototype that can be improved.  

◆ Next Generation Science Standards Grades 6-8 (Ages 11-14)  
  Engineering Design  
  Students who demonstrate understanding can:  
  ✦ MS-ETS1-2. Evaluate competing design solutions using a systematic process to determine how well they meet the criteria and constraints of the problem.  

◆ Standards for Technological Literacy - All Ages  
  The Nature of Technology  
  ✦ Standard 1: Students will develop an understanding of the characteristics and scope of technology.  
  ✦ Standard 2: Students will develop an understanding of the core concepts of technology.  
  ✦ Standard 3: Students will develop an understanding of the relationships among technologies and the connections between technology and other fields of study.  

  Technology and Society  
  ✦ Standard 4: Students will develop an understanding of the cultural, social, economic, and political effects of technology.  
  ✦ Standard 7: Students will develop an understanding of the influence of technology on history.
For Teachers:
Alignment to Curriculum Frameworks (continued)

◆ Standards for Technological Literacy - All Ages

Design
❖ Standard 8: Students will develop an understanding of the attributes of design.
❖ Standard 9: Students will develop an understanding of engineering design.
❖ Standard 10: Students will develop an understanding of the role of troubleshooting, research and development, invention and innovation, and experimentation in problem solving.

Abilities for a Technological World
❖ Standard 11: Students will develop abilities to apply the design process.

The Designed World
❖ Standard 18: Students will develop an understanding of and be able to select and use transportation technologies.
